
Anesthetic Management and One-Year Mortality After Noncardiac Surgery

Anesth Analg, 2005; 100:4-10

Implications: “A prospective, longitudinal study of 1-yr postoperative mortality after noncardiac surgery confirms that comorbidity is the primary predictor and that intraoperative hypotension and prolonged cumulative deep hypnotic time are also significant risk factors. Intraoperative anesthetic management may have a greater effect on long-term outcomes than previously appreciated.”
